

Apply filters to SQL queries

Project description

As a security professional, it's my job to filter through the databases to find and investigate potential security issues. SQL is used to store, manage and retrieve data within databases. Filters are used in SQL to get more precise results from the databases without having to sort through them manually, increasing efficiency.

Retrieve after hours failed login attempts

The SQL query used selects all columns from the log_in_attempts table and conditions the result that the login_time column has to show results after 18:00 and the success column has to output false. The use of the boolean operator AND helps make sure both conditions are true at the same time in the result.

```
MariaDB [organization]> SELECT *  
-> FROM log_in_attempts  
-> WHERE login_time > '18:00' AND success = FALSE;
```

event_id	username	login_date	login_time	country	ip_address	success

Retrieve login attempts on specific dates

The SQL query selects all columns from the log_in_attempts table and outputs the result on the condition that the login_date is 2022-05-09 or the login_date is 2022-05-08. The use of the boolean operator OR ensures the result show either dates

```
MariaDB [organization]> SELECT *
-> FROM log_in_attempts
-> WHERE login_date = '2022-05-09' OR login_date = '2022-05-08';
```

Retrieve login attempts outside of Mexico

The SQL query selects all columns from the log_in_attempts table and outputs the result on the condition that the country column is not Mexico. The use of the boolean operator NOT helps make sure to show everything in the column that isn't Mexico. Also, the use of the LIKE operator with the 'MEX%' command helps make sure there's nothing in the country table that starts with MEX as the results in the table are often output as MEX not MEXICO.

```
MariaDB [organization]> SELECT *
->
-> FROM log_in_attempts
->
-> WHERE NOT country LIKE 'MEX%';
```

Retrieve employees in Marketing

The SQL query selects all columns from the employee table and outputs the result on the condition that the department column is Marketing and the office column shows results that begin with East, which is filtered using the LIKE operator and %.

```
MariaDB [organization]> SELECT *
->
-> FROM employees
->
-> WHERE department = 'Marketing' AND office LIKE 'East%';
```

employee_id	device_id	username	department	office

Summary

The tasks I completed involved using boolean operators to filter through the databases and meet specific conditions to output the correct result. As a security professional, I found several issues that, without the use of SQL, would have potentially gone unnoticed or could have taken longer to find.
